Dibenzo(a,h)pyrene occurs in fossil fuels and is released to the environment as a product of incomplete combustion. If released to air, this compound is expected to exist solely in the particulate phase in the ambient atmosphere. Particulate-phase dibenzo(a,h)pyrene will be physically removed from the atmosphere by wet and dry deposition. If released to soil, it is expected to have low to no mobility. Volatilization is not expected to be an important fate process. Biodegradation in soil is expected to be a slow fate process. Adsorption to soil is expected to inhibit biodegradation. If released into water, it is expected to adsorb to suspended solids and sediment. Volatilization from water surfaces is not expected to occur. This substance may bioaccumulate.

No other information related to the ecological properties of this product is available at this time.
